MODULE NAME

Computer Programming 2

MODULE DESCRIPTION

Computer programming is the process of designing and building executable computer programs to accomplish a specific task or set of tasks. It involves writing and organizing code using programming languages, which act as a set of instructions that a computer can interpret and execute. Programmers use algorithms and logical structures to solve problems and create software applications, ranging from simple scripts to complex systems. Programming languages, such as Python, Java, C++, and others, serve as tools for expressing computational logic and instructing computers to perform various operations. The field of computer programming is fundamental to software development and plays a crucial role in powering the functionality of computers and digital devices.
